# CONTACT MANAGEMENT

Build an application for contact management. It should list, add/edit/remove contacts from list. Also user should be able to set any contact as their favourite.

For example, see the following screenshots.

Functionalities needs to be there:

- List of Contacts.
- Add button – which will open a new popup.
- For each record in the list – there should be edit/delete icons.
- If the same contact is added as favourite – by clicking the start – it will be displayed on right hand side list.
- If a user wants to remove the same from favourite's – user can click on remove icon on favourite's list or can click the yellow star.
- Search functionality – after entering the search phrase – user will need to click on the search icon and the list should be filtered out based on that

Add Contact Popup:

- When user click on the button on the list page – new popup window will appear.
- All fields are mandatory.
- Email and phone number – should have regex validation for proper data.
- Password and confirm password should match.
- There should be client and server side validation for the same.
- Discard button should hide the popup and clear our data of that popup.
